

# FX-SEER User Manual

## Usage recommendations:

- The FX-SEER is responsive to time frame or trading account changing while it is working. If you will change the period or account number during the trading the advisor will be stopped, the alert window will appear and the program will ask you to restart MetaTrader.
- It is not recommended to use FX-SEER cracked version even on study purpose because the EA is secured with special method which can allow working the cracked version but it will work the wrong way. Some of the blocks will be executed not correctly or sometimes the program will switch off. The cracked version usage can lead to money lose on trading accounts or to getting wrong test results.
- Currency pair: EURUSD
- Time Frame: 1 Hour (H1)
- Minimal deposit \$600 for 0.01 lot

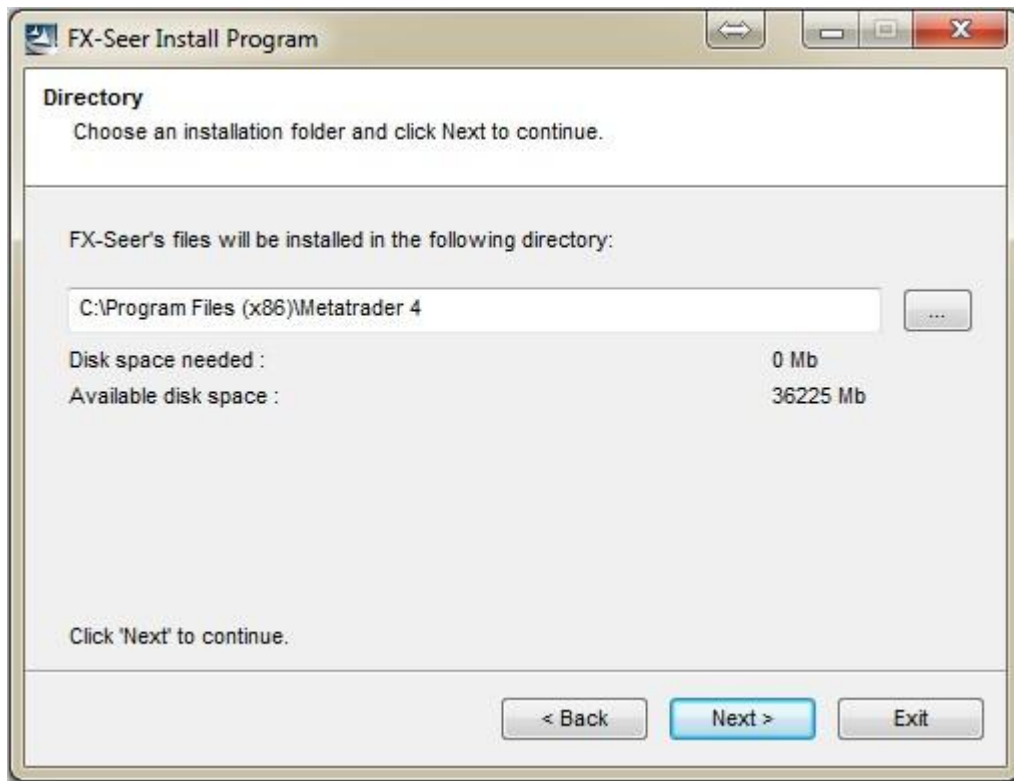

## RECOMMENDED SETTINGS:

Specify 50% of your deposit (in value) in the parameter "Deposit\_to\_Trade" and set 15% in the setting "Monthly\_Profit". Your deposit should be no less than \$1200 in order to use this settings,.

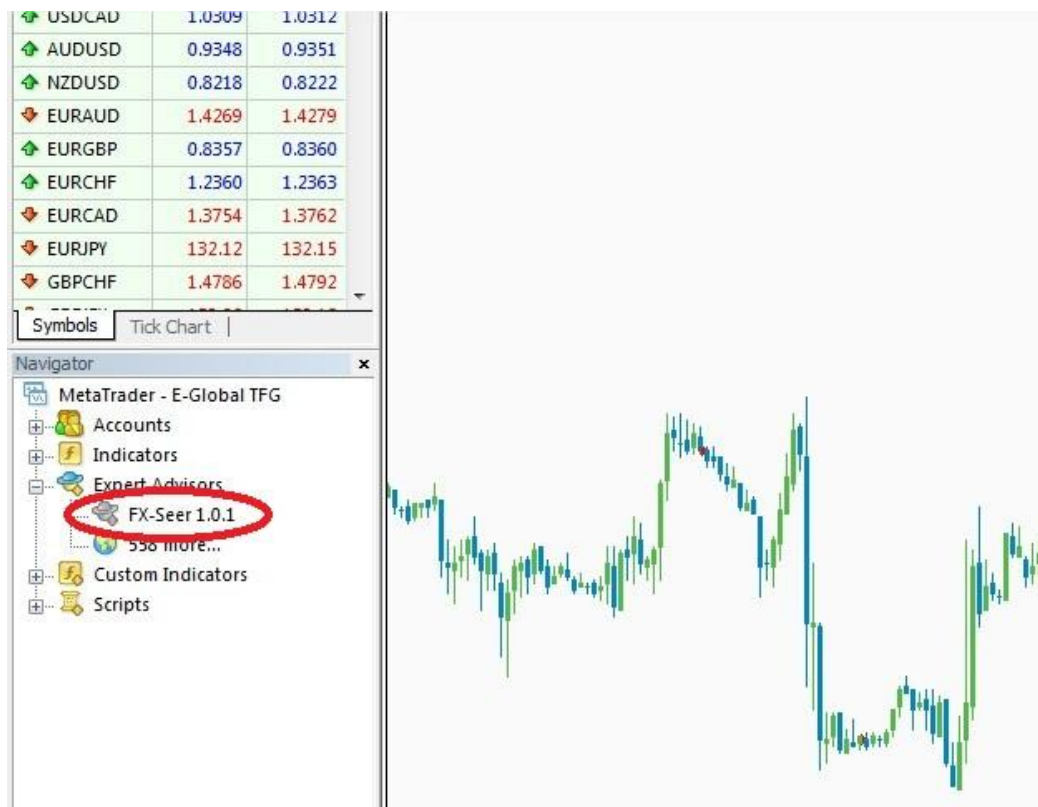

Recommended leverage is from 1.200

## Installation:

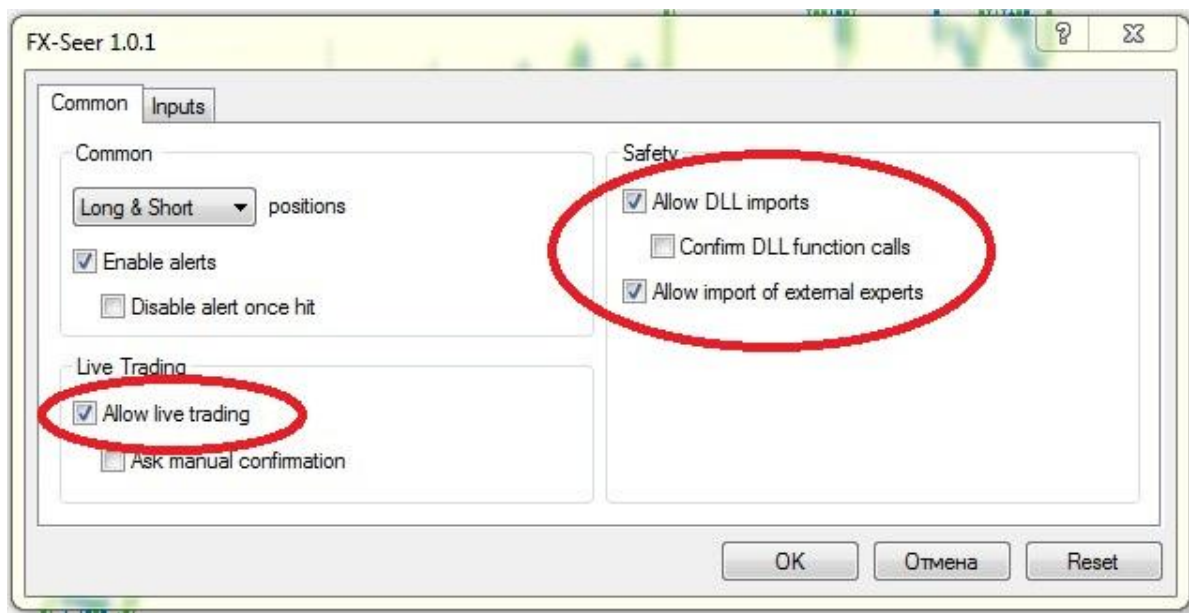

1. Open the archive that we sent you and run the Installation File.
2. In the following window enter the path to your MetaTrader folder.

3. After finishing of installation, run the trading terminal (MetaTrader).
4. You'll see the FX-Seer in the window "Navigator". Click it twice or drag and drop it to the chart.

5. The window with advisor settings will appear in front. Check the box in tab "Common" as it shown below.

**6.** In the tab "Inputs" you can enter your settings.

**8.** Now we need to check if everything is switched on and works correctly. The bottom "Expert Advisors" should be switched on, the smiley near the Advisor name should smile and the stripes in the point "Process" which is in Commentaries should move each time the quotations updating.

## Parameters:

**AutoGMT** – If set as **true**, the system will determine GMT of your broker and automatically compare it with Greenwich. If set as **false**, the system uses parameters from **ManualGMT**. Notice. Divergences can appear after switching to daylight saving time.

**Attention!** Auto GMT does not work during backtesting!

**ManualGMT** – Works only if the **AutoGMT** is turned off. It is necessary to indicate **ManualGMT** for backtesting. If you don't know your broker's GMT just drag and drop the advisor with turned-on **AutoGMT** on chart and in this case the advisor will show the data including broker's GMT on chart.

**Deposit\_to\_Trade** – Here you should indicate your start deposit or part of it with which you want to trade (profit and risks depend on it). **Attention!** If you don't set start deposit so the value remains "0", the lot calculation will be calculating on the principle of compound interest. This is more profitable and more risky method at the same time.

**Monthly\_Profit** – In this parameter you should specify the desirable monthly profit in the range from 5% to 120%. The lower is profitability the higher is reliability. The profitability is calculated according to the value in **Deposit\_to\_Trade**. For example:

Your deposit is \$10 000

You've indicated the following values in the advisor:

**Deposit\_to\_Trade = 5000**

**Monthly\_Profit = 50**

It means you'll be earning 50% from \$5000 per month. Taking to consideration that your deposit is \$10 000 your profit according to whole deposit will be 25%.

But owing to that you've specified **Deposit\_to\_Trade = 5000**, in the cases of force Majeure you'll lose only one half and still you will have remaining \$5 000 which allows you to continue trading and return all the losses.

## FAQ:

**Question:** After EA installation I launched a Metatrader 4, but your EA is missing in the Navigator window. What should I do?

**Answer:** If the EA was installed properly - during installation you had specified path to your MetaTrader root folder, like as C:\Program Files (x86)\Metatrader 4. In this case it seems like a bug of MT4 (build 509). To solve this problem you should re-install your MT4 platform. Then run it and login to your demo account (or real account). It will automatically update the platform. Close MT4 after updating and install EA once more.

**Question:** When I make a backtest, the EA doesn't open some trades, so I have zero result. What am I doing wrong?

**Answer:** Possibly you have left AutoGMT turned on in settings. You need to set AutoGMT option as 'false' and specify ManualGMT. It is necessary to indicate ManualGMT for backtesting. If you don't know your broker's GMT just drag and drop the advisor with switched-on AutoGMT on chart and in this case the advisor will show the data including broker's GMT.
